Final version

https://public.tableau.com/profile/jeffrey.ryu#!/vizhome/L8_project_baseball/story_final?publish=yes

Summary

I used the baseball data to visualize some information behind the data. As I was initially doing the project, I noticed that there were few players with same name that were distorting the graphs I was making in Tableau. I thus went back and cleaned the data and decided to show some information about the names. There were only two baseball stats available in the data: home runs and averages. Thus, I focused on showing these by comparing to other characteristic data.

Feedback

I had gotten a few feedbacks from five people along the way even before the first version was created. Thus, the first version incorporates some of their suggestions. The main change between the story_v1 and story_final is on the second section. I changed the 'Handedness' from the colored marks to a filter to be more interactive. Unfortunately, I just noticed that when I updated the worksheet with this change, the story_v1 also incorporated this change. So the version 1 and final version will look the same. The second change was that others were curious as to if there were any relationship between height and weight, so this was added to the final version as well.
